

Rebecca is currently working as a postdoctoral researcher in a multidisciplinary joint research unit of INRAE (France's National Research Institute for Agriculture, Food and Environment) and the National Veterinary School of Toulouse. She trained as a veterinarian and epidemiologist, and recently completed her PhD at the National Veterinary School of Toulouse on contextualising antimicrobial stewardship in poultry production. She has previously worked in the Antimicrobial Resistance and Veterinary Products Department of the World Organisation for Animal Health, and for the epidemiology consulting company Epimundi. Rebecca's current research interests centre on biosecurity and antimicrobial use in animal health, using both quantitative and qualitative approaches to better understand these practices. She also has strong interests in research methodology (in particular, qualitative research methods, interdisciplinary and transdisciplinary approaches).
